Click [Start subscription]( 5. Click [View]( 6. Enter your username or email address for access to the Vectir Remote Control webapp. 7. Click Sign in and navigate to the application. 8. Follow the instructions to download and install Vectir Remote Control on your PC or Mac. Register Vectir Remote Control can also be downloaded and installed manually from the [product page]( You may want to install the browser extension manually in order to receive push notifications and updates for new features. ![register-vectir](/static/images/doc-guides/vectir/register-vectir.png) Q: Swift initializing an object in the new object initialization I have a really simple question for you all. I have this class in swift. class City { var name = "" init(name: String) { self.name = name } init() { self.name = "" } I can initialize the object like so... let city = City() print(city.name) This works fine. However I also want to be able to initialize the object like so... let city = City("New York") And then it gives me a problem. When I try to initialize it this way it gives me a compilation error: "Use of unresolved identifier 'city'" I know that I can resolve it by doing this: city.name = "New York" But my question is. Why doesn't 82157476af
